

LANDSCAPING

Landscaping doesn't only add beauty to your home, but it can also improve your home's comfort and **lower your energy bills.**

On average, a well-designed landscape saves enough energy to pay for itself in less than **8 YEARS.**

Lower maintenance

Reduce your water use

Cut your heating and cooling costs

Protect your home from cold winter wind and hot summer sun

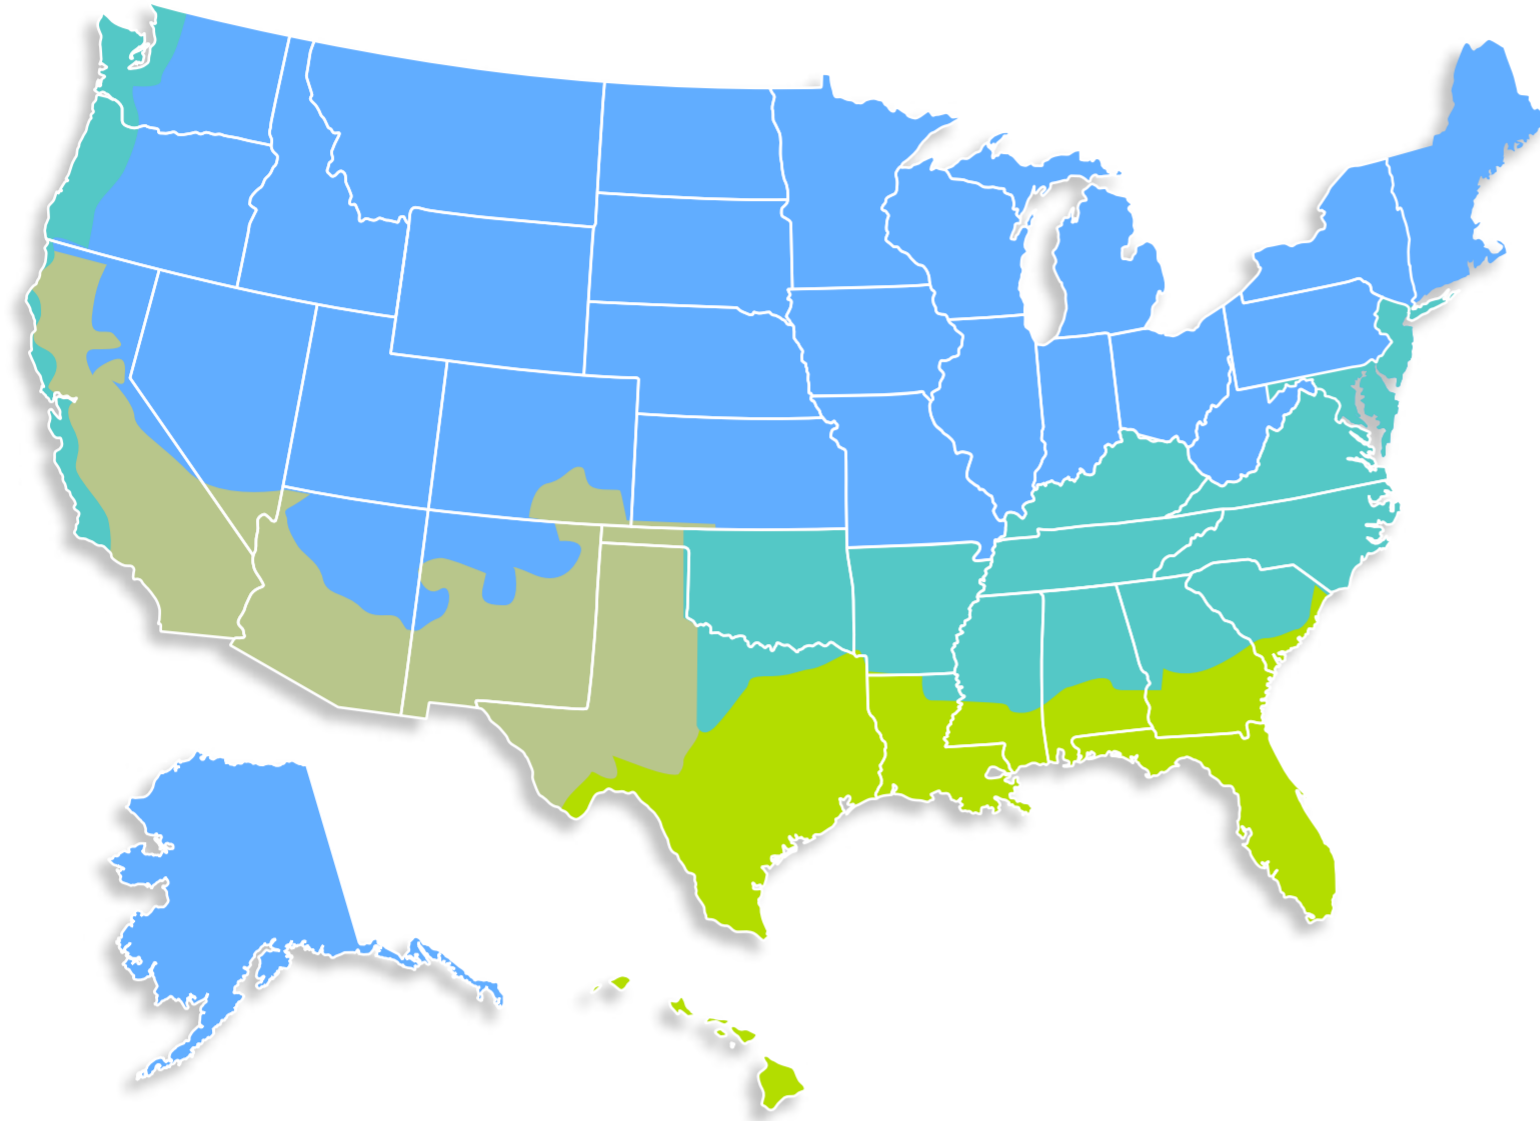

Help lower noise and air pollution

allowing you to better deal with water restrictions!

Top 3 Landscaping Strategies by Climate

The landscaping strategies you use depend on where you live in the U.S. and your home's microclimate.

What's a microclimate?

A microclimate is an area where the climate differs from the surrounding area. It can be as small as a few square feet or as large as a few square miles.

A microclimate impacts the type of plants that can grow in your landscape.

Temperate Region

Take advantage of the sun's warming effect in the winter. Shade your home from the hot summer sun. Deflect winter winds with windbreaks on the north and northwest sides of your house.

Hot-Arid Region

Provide shade to cool your home's walls, windows and roof. Naturally cool your home with summer winds. Cool the air around your home with plants.

Hot-Humid Region

Channel summer breezes toward your home to cool it. Use trees to shade your home in the summer but allow the sun to warm it in the winter. Avoid locating planting beds that require frequent watering close to your home.

Cool Region

Use dense windbreaks to protect the home from cold winter winds. Ensure the winter sun reaches south-facing windows. Shade the south and west sides of your home from the summer sun, if summer heat is a problem.

Landscaping for Shade

Shading is the most cost-effective way to reduce solar heat gain in your home and **cut air conditioning costs.** To effectively shade your home, you need to know the size, shape and location of the shadow that your shading device casts.

FACT: In tree-shaded neighborhoods, the summer daytime air temperature can be up to **6 degrees cooler** than in treeless areas.

#DidYouKnow: A well-planned landscape can reduce an unshaded home's air conditioning costs by **15-50 percent.**

Deciduous vs. Evergreen.

What's the difference?

Maple leaves change color with the seasons

Deciduous trees block solar heat in the summer but let in sunlight during the winter.

Evergreen trees and shrubs provide continuous shade.

Camphor trees are evergreen trees that can grow up to 30 m tall.

Planting Tips

Plant a **6-8 foot deciduous tree near your home**, and it will start shading your windows in the first year. Depending on the species and the home, it will shade the roof in **5-10 years.**

Plant **deciduous trees to the south of your home** -- they can screen 70-90 percent of the hot summer sun while allowing breezes through.

Plant trees with **crowns lower to the ground** on the west if you want to shade from lower, afternoon sun angles.

Plant **bushes, shrubs or climbing vines with a trellis** to shade your patio area.

To cool air before it reaches your home, plant **shrubs and groundcover plants.**

Landscaping for Windbreaks

A windbreak reduces heating costs by lowering the wind chill near your home. It also creates dead air space that insulates your home in the summer and winter.

#DidYouKnow:

Windbreaks to the north, west and east of houses cut fuel consumption by an average of 40 percent, according to a study in South Dakota.

Plant evergreen trees and shrubs to the **north and northwest** of your home to stop wind.

The distance between your home and windbreak should be **two to five times the height of the mature tree** for maximum protection.

Install a fence or wall in addition to evergreen trees to deflect the wind over your home.

If snow tends to drift in your area, **plant low shrubs on the windward side** of the windbreak to trap snow before it blows next to your home.

Plant trees on either side of your house to **direct cooling wind toward it** in the summer.

Landscaping for Water Conservation

Design your landscape to not only save energy but also conserve water.

Always group plants with **similar water needs together.**

Reduce the use of turf and use **low-water-use types of turf grass.**

Aerate your soil -- it improves water flow to plants' roots and reduces water runoff.

Water in the morning when it is cooler and evaporation rates are low.

Organize your turf grass in **continuous patterns** -- it's easier to maintain and uses less water.

In the summer, **raise your lawn mower cutting height** -- longer grass blades help shade each other & retain more water.

Use mulch to keep plant roots cool, minimize evaporation and reduce weed growth.
